

HOW TO PUT THE K/KL SOLID PANEL SHOWER DOOR BACK TOGETHER

Sometimes the top of the door disconnects from the rollers in the track. There is a pin coming down from the rollers that fits into the solid piece on the top of the door. It will come apart if the locking pin on the door part opens. This document will show you how to put it back together.

1. Remove the two screws in the track that stop the doors from going "too far".

2. Pull the door across the door way so it is no longer trapped by the shower pan bump and swing the door slightly towards the back doors giving access to the mechanism above the door.

3. After sliding the rolling mechanism with the pin to match up with the door part, use a screwdriver or other tool to move the catch lever to where it holds the pin in place.

4. How it looks with the lever in place.

5. Roll the door back in place and restore the screws removed in step 1.
